

Owen Eldridge

Full Stack Software Engineer

Remote, US-based (Tampa Bay Area, Florida)

hello@oweneldridge.io oweneldridge.io github.com/oweneldridge linkedin.com/in/oweneldridge

Skills

Languages and frameworks: Go, GORM, Python, PyTest, TypeScript, Node.js, React, Next.js, GraphQL (gqlgen), gRPC/Protobuf, Django, Ember.js, Redux, OAuth 2.0

Infrastructure and data: AWS (Lambda, S3, SQS, SNS, Kinesis, EKS, EventBridge, Step Functions, ECS, CDK, IAM, Secrets Manager), PostgreSQL, Redis, DynamoDB

Tools and practices: GitHub Actions, Docker, Podman, Datadog APM/Logs, Statsig, Playwright, Vitest, SonarCloud, CI/CD, microservices, feature-flag rollouts, Agile/Scrum

Experience

SmithRx

2025 to present

Software Engineer

Healthcare technology, pharmacy benefits management

- Engineering lead on a historical claims import platform in Go: designed the data model so adjudication, accumulators, and reporting could consume imported claims with no code changes from those teams, and delivered it code-complete across three repositories ahead of the deadline
- Owned cross-team data-integrity validation for a claims data migration: built a Go CLI validation suite with two dozen automated checks and a thorough unit test suite, wrote the source-to-target mapping and validation guide the team adopted, and independently verified the full dry-run at production scale
- Found and fixed a migration defect, heading off downstream eligibility, accumulator, and reporting errors
- Led cross-system data quality initiatives across the claims pipeline, finding and fixing systemic issues, with production corrections delivered through formal change control
- Root-caused a billing-data discrepancy, then fixed the PostgreSQL query plan behind it, taking a large-scale member resolution from twenty minutes to seconds
- Investigated and resolved production reporting incidents through root cause analysis, and wrote the correction runbooks so the fixes outlived the incidents
- Built Python automation for production claims analysis that turned hours of manual batch work into minutes, adopted as the operations team's standard workflow
- Designed GraphQL APIs in Go (gqlgen) bringing cost calculation transparency to pharmacy claims, with Relay-compliant patterns, graceful degradation for older data, and shared fragments that cut frontend duplication
- Performed 100+ code reviews per quarter across 8 repositories, catching security vulnerabilities, data integrity bugs, and race conditions before they shipped

Indigo Tech Group, a Mindbody company

2023 to 2025

Technical Lead, Full Stack Software Engineer

Payments platform, since renamed Kite Technologies

- Authored Python coding standards based on PEP 8/257 that became the team baseline, covering layout, naming, error handling, and documentation while keeping the payments platform PCI compliant

- Engineered a webhook subscription management system on AWS Lambda and DynamoDB, enabling real-time payment event notifications to external systems
- Built card-present transaction processing by integrating the TriPOS Cloud API with Payrix, from POS terminal communication through transaction storage
- Architected a secure, responsive iframe payment component in Next.js and TypeScript for credit card and bank account management inside the core application
- Restructured monolithic Lambdas into modular microservices with PyTest suites at 80%+ coverage, surfacing 60+ bugs along the way
- Designed the Datadog tagging schema and monitoring strategy across payment services, cutting incident response time through structured, contextual logging
- Mentored junior engineers through reviews and pairing, on Pythonic idioms, data structures, and test-driven development

Mariana Tek | Xplor Technologies

2022 to 2023

Full Stack Software Engineer

Boutique fitness studio management SaaS

- Developed the Ember.js admin application and Django REST APIs for a multi-tenant platform serving national boutique fitness brands
- Implemented cart and checkout features including line-item discounts, quick-sale modals, and payment flows for in-studio point of sale
- Built automated end-to-end suites in Selenium and Python covering check-in, checkout, and class reservation flows
- Engineered a multi-tenant customization framework letting franchise clients ship white-labeled apps with their own styling and feature sets

Spearmint (OS Labs open-source accelerator)

2021 to 2022

Software Engineer

Accessibility-focused GUI for generating JavaScript tests, 1,000+ GitHub stars

- Materially improved application performance and cut code editor memory use by roughly 60% by replacing heavyweight dependencies while preserving full terminal emulation
- Extended TypeScript coverage through the React-Redux layer so action creators, reducers, and state were checked at compile time
- Implemented Redux for immutable, predictable state, eliminating unnecessary re-renders and prop drilling

Education

Florida Atlantic University, Computer Science coursework. Johnson & Wales University, BS.

Off hours

Homelab and self-hosting, open-source tinkering, classical guitar, adventure cycling, travel, and cooking most of the world's cuisines at home.
